

SELECT CLASS

There are 2 types of dropdowns/ list boxes

1. Single select
2. Multi select

Almost all the dropdowns will be created using “Select” tag and content of the dropdown will be created using “option” tag.

To handle dropdown, we use Select class of selenium.

Select class has parameterized constructor, where it takes an argument of type WebElement(address of the dropdown).

There are 3 ways to handle dropdowns.

1. findElement() and findElements().
2. By using Robot class.
3. By using Select class(In Selenium, we usually do this).

How to handle/use select class

1. Create an object of Select class
Select select=new Select(WebElement address);
2. With the help of reference variable, we can call 11 methods.

selectByIndex(int Index)		Return type is void
selectByValue(String value)		
selectByVisibleText(String text)		
deselectByIndex(int Index)		
deselectByValue(String value)		
deselectByVisibleText(String text)		
deselectAll()		
getFirstSelectedOption()		Return type is WebElement
getAllSelectedOption()		Return type is List<WebElement>
getOptions()		
isMultiple()		Return type is boolean
